Classification of weld defects detected by ultrasonics using signal processing techniques

DRAI Redouane, Khelil Mohamed, Benchaala Amar

Abstract : Discriminatory features from temporal and spetral signals of detected echo are extracted, the compact feature vector obtained will be then classified by different methods: K Nearest Neighbour algorithm, statistical bayesian algorithm and artificial neural network, other discriminatory features using a multiresolution analysis technique, callled discret wavelet transform are also extracted, then, the obtained feature vector will be also classified by the same algorithms, experimental results obtained from a data bank constituted by echoes detected in welds will be compared and discussed.

Keywords: NDT, Ultrasonics, defects classification, digital wavelets transform, neural networks
