Physical investigations on perovskite LaMnO$_{3-\delta}$ sprayed thin films for spintronic applications

https://doi.org/10.1016/j.materresbull.2015.10.003

Abstract

Oxygen deficient LaMnO$_3$ thin films were successfully grown on glass substrate by spray pyrolysis at 460 °C. XRD studies show oxygen vacancies corresponding to the orthorhombic La$_4$Mn$_4$O$_{11}$ with (040) preferential orientation. Optical properties were investigated through optical band gap and Urbach energy. The dispersion of the refractive index was discussed in terms of both Cauchy and Wemple & Diodomenico models. Raman spectroscopy shows the band positions corresponding to LaMnO$_3$ with a shift related to oxygen deficiency. Electrical properties were quantified using impedance spectroscopy technique within frequency range of 5 Hz–13 MHz at various temperatures. Both the DC conductivity and relaxation frequency were thermally activated with activation energy around 0.9 eV. Also, AC conductivity was investigated through Jonscher law. Finally, magnetic measurements at room temperature using vibrating sample magnetometer (VSM) technique show ferromagnetic behavior of these ternary sprayed thin films.
